## File II

# fontspec-code-load.dtx

## 1 The fontspec.sty loading file

Before we begin, for the rest of the package we use the @@ expl3 module syntax with module name 'fontspec'.

```
1 <@@=fontspec>
```

The fontspec.sty file is simply set up to load the appropriate fontspec-xetex.sty or fontspec-luatex.sty file. This is performed by the following code.

```
2 <*load>
```

### Lua<sup>A</sup>T<sub>E</sub>X

```
3 \sys_if_engine_luatex:T
4 {
5   \RequirePackage{luaotfload}
6   \lua_now:e{require("fontspec")}
7   \RequirePackage{fontspec-luatex}
8   \endinput
9 }
```

### X<sub>E</sub>L<sup>A</sup>T<sub>E</sub>X

```
10 \sys_if_engine_xetex:T
11 {
12   \RequirePackage{fontspec-xetex}
13   \endinput
14 }
```

**Other** If not one of the above, error and exit.

```
15 \msg_new:nnn {fontspec} {cannot-use-pdftex}
16 {
17   The~ fontspec~ package~ requires~ either~ XeTeX~ or~ LuaTeX.\\
18   You~ must~ change~ your~ typesetting~ engine~ to,~ e.g.,~
19   "xelatex"~ or~ "lualatex"~ instead~ of~ "latex"~ or~ "pdflatex".
20 }
21 \msg_fatal:nn {fontspec} {cannot-use-pdftex}
```

**Closing** That's the end of the fontspec.sty file.

```
22 \endinput
23 </load>
```

## File III

# fontspec-code-vars.dtx

## 1 Variables

---

`\l_@@_firsttime_bool` As `\keys_set:nn` is run multiple times, some of its information storing only occurs once while we decide if the font family has been defined or not. When the later processing is occurring per-shape this no longer needs to happen; this is indicated by the ‘firsttime’ conditional.

---

`\l_@@_never_check_bool` Used to disable checking opentype script, language, and tags when running checking code that has a user-defined return path we want to allow the higher-level code to dictate the logic. TODO: tidy this up!

## 2 Implementation

This file consists solely of declaration of variables used by `fontspec`. In some cases these variables are also initialised with default values.

**Booleans for package options** For package options:

```
1 <*options>
2 \bool_new:N \g_@@_cfg_bool
3 \bool_new:N \g_@@_math_bool
4 </options>
5 <*fontspec>
```

**Booleans for flow control**

`\l_@@_firsttime_bool`

```
6 \bool_new:N \l_@@_firsttime_bool
```

*(End of definition for `\l_@@_firsttime_bool`. This function is documented on page 9.)*

`\l_@@_never_check_bool`

```
7 \bool_new:N \l_@@_never_check_bool
```

*(End of definition for `\l_@@_never_check_bool`. This function is documented on page 9.)*

## Booleans for processing logic

```
8 \bool_new:N \l_@@_nobf_bool
9 \bool_new:N \l_@@_noit_bool
10 \bool_new:N \l_@@_nosc_bool
11 \bool_new:N \l_@@_check_bool

12 \bool_new:N \l_@@_tfm_bool
13 \bool_new:N \l_@@_atsui_bool
14 \bool_new:N \l_@@_ot_bool
15 \bool_new:N \l_@@_mm_bool
16 \bool_new:N \l_@@_harfbuzz_bool
17 \bool_new:N \l_@@_graphite_bool
18 \bool_new:N \l_@@_fontcfg_bool
19 \bool_set_true:N \l_@@_fontcfg_bool
```

For dealing with legacy maths:

```
20 \bool_new:N \g_@@_math_euler_bool
21 \bool_new:N \g_@@_math_lucida_bool
22 \bool_new:N \g_@@_pkg_euler_loaded_bool

23 \bool_new:N \l_@@_tmpa_bool
24 \bool_new:N \l_@@_disable_defaults_bool
25 \bool_new:N \l_@@_alias_bool
26 \bool_new:N \l_@@_external_bool
27 \bool_new:N \l_@@_defining_encoding_bool
28 \bool_new:N \l_@@_scriptlang_exist_bool
29 \bool_new:N \g_@@_em_normalise_slant_bool
30 \bool_new:N \l_@@_external_kpse_bool
```

## Counters

## File IV

# fontspec-code-msg.dtx

## 1 Error/warning/info messages

---

```
\@@_msg_new:nn \@@_msg_new:nn {<msg id>} {<message>}
\@@_msg_new:nnn \@@_msg_new:nnn {<msg id>} {<message>} {<additional text>}
```

---

These functions define messages using the standard `\msg_new:nnn(n)` commands. Wrappers are used to pre-set the package name and to trim spaces, allowing for convenient definition later in this file.

An additional linebreak is added to avoid awkward breaks when the filename is included in the error message.

## 2 Implementation

### 2.1 Messages for package options

```

(End of definition for \@@\_msg\_new:nn and \@@\_msg\_new:nnn. These functions are documented on page 15.)

Allow messages to be written with spaces acting as normal:

```

## 1 Opening code

---

`\FontspecSetCheckBoolTrue` Allows easy return of boolean results (`\l_@@_check_bool`) without requiring specific catcode regimes. Used within Lua functions.  
`\FontspecSetCheckBoolFalse`

---

`\@@_keys_set_known:nnN` Wrapper around standard `\keys_set_known:nnN` which permits debugging.  
`\@@_keys_set_known:nxN`

---

`\@@_int_mult_truncate:Nn` `\@@_int_mult_truncate:nn` `<int>` `{<scale>}`  
Scales `<integer variable>` by `<scale>`, discarding any fractional components. E.g.,

```
% \int_new:N \foo
% \int_set:Nn \foo {3}
% \__fontspec_int_mult_truncate:Nn \foo {3.3}
% \int_show:N \foo % \foo = 9
%
% \int_set:Nn \foo {3}
% \__fontspec_int_mult_truncate:Nn \foo {3.4}
% \int_show:N \foo % \foo = 10
```

---

`\@@_lua_function:ne` `\@@_lua_function:ne` `{<method>}` `{<arg. 1>}`  
`\@@_lua_function:nee` Wrapper around `\lua_now:e`, hard-coded to refer to a method of the fontspec module.  
`\@@_lua_function:neee` `\@@_lua_function:ne` `{foo}` `{bar}` executes `fontspec.foo("bar")` in the Lua engine.  
`\@@_lua_function:neeee` Variants for up to four arguments are provided.

## 2 Implementation

### 2.1 Package options

```

9   ,config .usage:n = load
```

```

10 ,no-config .bool_gset_inverse:N = \g_@@_cfg_bool
11 ,no-config .usage:n = load
12 ,cm-default .code:n = { \msg_warning:nn {fontspec} {cm-default-obsolete} }
13 ,euenc .code:n = { \msg_warning:nnn {fontspec} {enc-obsolete}{euenc} }
14 ,tuenc .code:n = { \msg_warning:nnn {fontspec} {enc-obsolete}{tuenc} }
15 ,quiet .code:n =
16 {
17 \msg_redirect_module:nnn { fontspec } { warning } { info }
18 \msg_redirect_module:nnn { fontspec } { info } { none }
19 }
20 ,silent .code:n =
21 {
22 \msg_redirect_module:nnn { fontspec } { warning } { none }
23 \msg_redirect_module:nnn { fontspec } { info } { none }
24 }
25 ,verbose .code:n =
26 {
27 \msg_redirect_module:nnn { fontspec } { warning } { warning }
28 \msg_redirect_module:nnn { fontspec } { info } { info }
29 }
30 }
31 \SetKeys{config,math}
32 \ProcessKeyOptions

```

## 2.2 Encodings

Now the default, with a just-in-case check:

```

33 \cs_if_exist:cF {T@TU}
34 {
35 \@@_warning:n {tu-clash}
36 \DeclareFontEncoding{TU}{-}{-}
37 \DeclareFontSubstitution{TU}{lmr}{m}{n}
38 }
39 \tl_gset:Nn \g_fontspec_encoding_tl { TU }
40 \tl_set:Nn \rmdefault {lmr}
41 \tl_set:Nn \sfdefault {lmss}
42 \tl_set:Nn \ttdefault {lmtt}
43 \RequirePackage[\g_fontspec_encoding_tl]{fontenc}
44 \tl_set_eq:NN \UTFencname \g_fontspec_encoding_tl % for xunicode if needed

```

To overcome the encoding changing the current font size, but only if a class has been loaded first:

```

45 \tl_if_in:NnT \@filelist {.cls} { \normalsize }

```

Dealing with a couple of the problems introduced by babel:

```

46 \tl_set_eq:NN \cyrillicencoding \g_fontspec_encoding_tl
47 \tl_set_eq:NN \latinencoding \g_fontspec_encoding_tl
48 \AtBeginDocument
49 {
50 \tl_set_eq:NN \cyrillicencoding \g_fontspec_encoding_tl
51 \tl_set_eq:NN \latinencoding \g_fontspec_encoding_tl
52 }

```

That latin encoding definition is repeated to suppress font warnings. Something to do with `\select@language` ending up in the `.aux` file which is read at the beginning of the document.

## 2.3 Generic functions

These strange set functions are to simplify returning code from LuaTeX:

```
\FontspecSetCheckBoolTrue
\FontspecSetCheckBoolFalse

## 1 expl3 interface for primitive font loading

---

```
\@@_primitive_font_set:Nnn \@@_primitive_font_set:Nnn <font cs> <{file/name}> <{size (dim. expr)}>
\@@_primitive_font_gset:Nnn
```

Wrapper around  $\TeX$  `\font` primitive.

---

```
\@@_font_suppress_not_found_error:
```

Wrapper around  $X_{\text{F}}\text{T}_{\text{E}}\text{L}_{\text{u}}\text{a}\text{T}_{\text{E}}\text{X}$  primitive, used to be able to programmatically query font existence.

---

```
\@@_primitive_font_if_null_p:N * \@@_primitive_font_if_null:NTF <font cs> <{true code}> <{false code}>
\@@_primitive_font_if_null:NTF *
```

Query whether the `<font cs>` is the `\nullfont`.

---

```
\@@_primitive_font_set:NnnTF \@@_primitive_font_set:NnnTF <font cs> <{file/name}> <{size (dim. expr)}> <{true
\@@_primitive_font_gset:NnnTF code}> <{false code}>
```

Attempts to set the `<font cs>` and provide branching for success or failure according to whether the font exists.

---

```
\@@_primitive_font_if_exist:nTF \@@_primitive_font_if_exist:nTF <{file/name}> <{true code}> <{false code}>
```

Attempts to load the font at the current font size minus 1sp with a dummy metafont cs (`\l_@@_primitive_font`), and branches according to whether the font exists. This is intended to be used speculatively before potentially performing additional processing steps (e.g., an analysis of available font features) before setting up the ‘true’ font.

---

```
\@@_primitive_font_glyph_if_exist_p:Nn * \@@_primitive_font_glyph_if_exist:nTF <font cs> <{char. number (int.
\@@_primitive_font_glyph_if_exist:NnTF * expr)}> <{true code}> <{false code}>
```

Wrapper around primitive `\iffontchar`.

---

```
\@@_primitive_font_set_hyphenchar:Nn \@@_primitive_font_set_hyphenchar:Nn <font cs> <{char. number (int.
expr)}>
```

Setter function around primitive `\hyphenchar`.

---

```
\@@_primitive_font_get_name:N \@@_primitive_font_get_name:N <font cs>
\@@_primitive_font_current_name:
```

Wrapper function around  $\TeX$  primitive `\fontname`. The no-argument version is equivalent to `\fontname\font`.

## 1 User commands

This section contains the definitions of the commands detailed in the user documentation. Only the ‘top level’ definitions of the commands are contained herein; they all use or define macros which are defined or used later on in [Section 1 on page 32](#).

---

`\fontspec` `\fontspec` [*options*] {*font name/file*} [*options*]

Defines a dummy font with specified options and font name/file.

---

`\setmainfont` `\setmainfont` [*options*] {*font name/file*} [*options*]

`\setsansfont`  
`\setmonofont` Defines the standard rm/sf/tt font families with specified options and font name/file.

---

`\setmathrm` `\setmathrm` [*options*] {*font name/file*} [*options*]

`\setboldmathrm`  
`\setmathsf`  
`\setmathtt` Defines the standard `\mathrm/sf/tt` font families with specified options and font name/file. `\setboldmathrm` sets the `\mathrm` font when `\boldmath` is active.

---

`\setromanfont` `\setromanfont` [*options*] {*font name/file*} [*options*]

Deprecated alias for `\setmainfont`.

---

`\newfontfamily` `\setromanfont` *font switch cs* [*options*] {*font name/file*} [*options*]

`\renewfontfamily`  
`\setfontfamily` Defines font family as specified, activated using the *font switch cs*.

`\providefontfamily`

---

`\newfontface` `\setromanfont` *font switch cs* [*options*] {*font name/file*} [*options*]

`\renewfontface`  
`\setfontface`  
`\providefontface` Defines font family as specified, activated using the *font switch cs*. Only the exact font specified will be defined, without attempting to find bold/italic/etc. shapes.

---

`\oldstylenums` `{\oldstylenums 123} {\liningnums 123} → 123 123`

`\liningnums` Re-implementations of font-switching commands which activate the necessary font features (onum and lnum in OpenType).

## 2 Implementation

`\fontspec`

```
1 \NewDocumentCommand \fontspec { O{} m O{} }  
2 {
```

```

3     \@@_main_fontspec:nn {#1,#3} {#2}
4     \ignorespaces
5   }

```

(End of definition for `\fontspec`. This function is documented on page 27.)

```

\setmainfont
\setsansfont
\setmonofont

```

```

6 \NewDocumentCommand \setmainfont { 0{} m 0{} }
7 {
8   \@@_main_setmainfont:nn {#1,#3} {#2}
9   \ignorespaces
10  }
11 \NewDocumentCommand \setsansfont { 0{} m 0{} }
12 {
13   \@@_main_setsansfont:nn {#1,#3} {#2}
14   \ignorespaces
15  }
16 \NewDocumentCommand \setmonofont { 0{} m 0{} }
17 {
18   \@@_main_setmonofont:nn {#1,#3} {#2}
19   \ignorespaces
20  }

```

(End of definition for `\setmainfont`, `\setsansfont`, and `\setmonofont`. These functions are documented on page 27.)

```

\setmathrm
\setboldmathrm
\setmathsf
\setmathtt

```

```

21 \NewDocumentCommand \setmathrm { 0{} m 0{} }
22 {
23   \@@_main_setmathrm:nn {#1,#3} {#2}
24  }
25 \NewDocumentCommand \setboldmathrm { 0{} m 0{} }
26 {
27   \@@_main_setboldmathrm:nn {#1,#3} {#2}
28  }
29 \NewDocumentCommand \setmathsf { 0{} m 0{} }
30 {
31   \@@_main_setmathsf:nn {#1,#3} {#2}
32  }
33 \NewDocumentCommand \setmathtt { 0{} m 0{} }
34 {
35   \@@_main_setmathtt:nn {#1,#3} {#2}
36  }

```

(End of definition for `\setmathrm` and others. These functions are documented on page 27.)

`\setromanfont` This is the old name for `\setmainfont`, retained *ad infinitum* for backwards compatibility. It was deprecated in 2010.

```

37 \NewDocumentCommand \setromanfont { 0{} m 0{} }
38 {
39   \@@_main_setmainfont:nn {#1,#3} {#2}
40  }

```

(End of definition for `\setromanfont`. This function is documented on page 27.)

```
\newfontfamily
\renewfontfamily 41 \NewDocumentCommand \newfontfamily { m O{} m O{} }
\setfontfamily    42 {
\providefontfamily 43   \@@_main_newfontfamily:NnnN #1 {#2,#4} {#3} \NewDocumentCommand
44 }
45 \NewDocumentCommand \renewfontfamily { m O{} m O{} }
46 {
47   \@@_main_newfontfamily:NnnN #1 {#2,#4} {#3} \RenewDocumentCommand
48 }
49 \NewDocumentCommand \setfontfamily { m O{} m O{} }
50 {
51   \@@_main_newfontfamily:NnnN #1 {#2,#4} {#3} \DeclareDocumentCommand
52 }
53 \NewDocumentCommand \providefontfamily { m O{} m O{} }
54 {
55   \@@_main_newfontfamily:NnnN #1 {#2,#4} {#3} \ProvideDocumentCommand
56 }
```

(End of definition for `\newfontfamily` and others. These functions are documented on page 27.)

```
\newfontface
\renewfontface 57 \NewDocumentCommand \newfontface { m O{} m O{} }
\setfontface   58 {
\providefontface 59   \@@_main_newfontface:NnnN #1 {#2,#4} {#3} \NewDocumentCommand
60 }
61 \NewDocumentCommand \renewfontface { m O{} m O{} }
62 {
63   \@@_main_newfontface:NnnN #1 {#2,#4} {#3} \RenewDocumentCommand
64 }
65 \NewDocumentCommand \setfontface { m O{} m O{} }
66 {
67   \@@_main_newfontface:NnnN #1 {#2,#4} {#3} \DeclareDocumentCommand
68 }
69 \NewDocumentCommand \providefontface { m O{} m O{} }
70 {
71   \@@_main_newfontface:NnnN #1 {#2,#4} {#3} \ProvideDocumentCommand
72 }
```

(End of definition for `\newfontface` and others. These functions are documented on page 27.)

`\defaultfontfeatures` This macro takes one argument that consists of all of feature options that will be applied by default to all subsequent `\fontspec` commands.

```
73 \NewDocumentCommand \defaultfontfeatures { t+ o m }
74 {
75   \IfNoValueTF {#2}
76     { \@@_set_default_features:nn {#1} {#3} }
77     { \@@_set_font_default_features:nnn {#1} {#2} {#3} }
78   \ignorespaces
79 }
```

*(End of definition for \defaultfontfeatures. This function is documented on page ??.)*

```
80 \NewDocumentCommand \addfontfeatures {m}
81 {
82   \@@_main_addfontfeatures:n {#1}
83 }
84 \NewDocumentCommand \addfontfeature {m}
85 {
86   \@@_main_addfontfeatures:n {#1}
87 }
88 \NewDocumentCommand \newfontfeature {mm}
89 {
90   \@@_main_newfontfeature:nn {#1} {#2}
91 }
92 \NewDocumentCommand \newAATfeature {mmmm}
93 {
94   \@@_main_newAATfeature:nnnn {#1} {#2} {#3} {#4}
95 }
96 \NewDocumentCommand \newopentypefeature {mmm}
97 {
98   \@@_main_newopentypefeature:nnn {#1} {#2} {#3}
99 }
```

`\newICUfeature` **Deprecated.**

```
100 \NewDocumentCommand \newICUfeature {mmm}
101 {
102   \@@_main_newopentypefeature:nnn {#1} {#2} {#3}
103 }
104 \NewDocumentCommand \aliasfontfeature {mm}
105 {
106   \@@_main_aliasfontfeature:nn {#1} {#2}
107 }
108 \NewDocumentCommand \aliasfontfeatureoption {mmm}
109 {
110   \@@_main_aliasfontfeatureoption:nnn {#1} {#2} {#3}
111 }
```

`\newfontscript` Mostly used internally, but also possibly useful for users, to define new OpenType ‘scripts’, mapping logical names to OpenType script tags.

```
112 \NewDocumentCommand \newfontscript {mm}
113 {
114   \fontspec_new_script:nn {#1} {#2}
115 }
```

*(End of definition for \newfontscript. This function is documented on page ??.)*

`\newfontlanguage` Mostly used internally, but also possibly useful for users, to define new OpenType ‘languages’, mapping logical names to OpenType language tags.

```
116 \NewDocumentCommand \newfontlanguage {mm}
117   {
118     \fontspec_new_lang:nn {#1} {#2}
119   }

(End of definition for \newfontlanguage. This function is documented on page ??.)

120 \NewDocumentCommand \DeclareFontExtensions {m}
121   {
122     \@@_main_DeclareFontExtensions:n {#1}
123   }

124 \NewDocumentCommand \IfFontFeatureActiveTF {mmm}
125   {
126     \@@_main_IfFontFeatureActiveTF:nnn {#1} {#2} {#3}
127   }
```

`\oldstylenums` This is performed only after the preamble to overwrite any redefinition by `textcomp`:

```
128 \AtBeginDocument
129   {
130     \RenewDocumentCommand \oldstylenums {m}
131       {
132         \@@_main_oldstylenums:n {#1}
133       }
134   }

(End of definition for \oldstylenums. This function is documented on page 27.)
```

`\liningnums`

```
135 \NewDocumentCommand \liningnums {m}
136   {
137     \@@_main_liningnums:n {#1}
138   }

(End of definition for \liningnums. This function is documented on page 27.)
```

## 1 User command internals

### 1.1 Font selection

`\@@_main_fontspec:nn` This is the main command of the package that selects fonts with various features. It takes two arguments: the font name and the optional requested features of that font.

```
1 \cs_new:Nn \@@_main_fontspec:nn
2 {
3   \fontspec_set_family:Nnn \f@family {#1} {#2}
4   \fontencoding { \g_@@_nfss_enc_tl }
5   \selectfont
6 }
```

*(End of definition for \@@\_main\_fontspec:nn. This function is documented on page ??.)*

`\rmfamily` Add an encoding switch to the three family commands.

```
\sffamily
\ttfamily
7 \cs_if_exist:NTF \@rmfamilyhook
8 {
9   \tl_put_right:Nn \@rmfamilyhook {\fontencoding \l_@@_rmfamily_encoding_tl}
10  \tl_put_right:Nn \@sffamilyhook {\fontencoding \l_@@_sffamily_encoding_tl}
11  \tl_put_right:Nn \@ttfamilyhook {\fontencoding \l_@@_ttfamily_encoding_tl}
12 }
13 {
14   \tl_replace_all:cnn { rmfamily~ } { \fontfamily }
15   { \fontencoding \l_@@_rmfamily_encoding_tl \fontfamily }
16   \tl_replace_all:cnn { sffamily~ } { \fontfamily }
17   { \fontencoding \l_@@_sffamily_encoding_tl \fontfamily }
18   \tl_replace_all:cnn { ttfamily~ } { \fontfamily }
19   { \fontencoding \l_@@_ttfamily_encoding_tl \fontfamily }
20 }
21 \tl_set:Nn \l_@@_rmfamily_encoding_tl { \encodingdefault }
22 \tl_set:Nn \l_@@_sffamily_encoding_tl { \encodingdefault }
23 \tl_set:Nn \l_@@_ttfamily_encoding_tl { \encodingdefault }
```

*(End of definition for \rmfamily, \sffamily, and \ttfamily. These functions are documented on page ??.)*

`\setmainfont` The following three macros perform equivalent operations setting the default font for a particular family: ‘roman’, sans serif, or typewriter (monospaced).

They end with `\normalfont` so that if they’re used in the document, the change registers immediately.

```
24 \cs_new:Nn \@@_main_setmainfont:nn
25 {
26   <debug>\typeout{:~_main_setmainfont:nn}
27   \ifdefined\DeclareFontSeriesDefault
28     \DeclareFontSeriesDefault [rm] {bf} {\bfdefault}
29   \fi
```

```

30 \fontspec_set_family:Nnn \l_@@_rmfamily_family_tl {#1} {#2}
31 \tl_set_eq:NN \rmdefault \l_@@_rmfamily_family_tl
32 \tl_set_eq:NN \l_@@_rmfamily_encoding_tl \g_@@_nfss_enc_tl
33 \str_if_eq:eeT {\familydefault} {\rmdefault}
34 { \tl_set_eq:NN \encodingdefault \g_@@_nfss_enc_tl }
35 \@@_setmainfont_hook:nn {#1} {#2} % for unicode-math only
36 \normalfont
37 }

```

(End of definition for `\setmainfont`. This function is documented on page 27.)

**`\setsansfont`** Same as above.

```

38 \cs_new:Nn \@@_main_setsansfont:nn
39 {
40   \ifdefined\DeclareFontSeriesDefault
41     \DeclareFontSeriesDefault[sf]{bf}{\bfdefault}
42   \fi
43   \fontspec_set_family:Nnn \l_@@_sffamily_family_tl {#1} {#2}
44   \tl_set_eq:NN \sfdefault \l_@@_sffamily_family_tl
45   \tl_set_eq:NN \l_@@_sffamily_encoding_tl \g_@@_nfss_enc_tl
46   \str_if_eq:eeT {\familydefault} {\sfdefault}
47   { \tl_set_eq:NN \encodingdefault \g_@@_nfss_enc_tl }
48   \@@_setsansfont_hook:nn {#1} {#2} % for unicode-math only
49   \normalfont
50 }

```

(End of definition for `\setsansfont`. This function is documented on page 27.)

**`\setmonofont`** Same as above.

```

51 \cs_new:Nn \@@_main_setmonofont:nn
52 {
53   \ifdefined\DeclareFontSeriesDefault
54     \DeclareFontSeriesDefault[tt]{bf}{\bfdefault}
55   \fi
56   \fontspec_set_family:Nnn \l_@@_ttfamily_family_tl {#1} {#2}
57   \tl_set_eq:NN \ttdefault \l_@@_ttfamily_family_tl
58   \tl_set_eq:NN \l_@@_ttfamily_encoding_tl \g_@@_nfss_enc_tl
59   \str_if_eq:eeT {\familydefault} {\ttdefault}
60   { \tl_set_eq:NN \encodingdefault \g_@@_nfss_enc_tl }
61   \@@_setmonofont_hook:nn {#1} {#2} % for unicode-math only
62   \normalfont
63 }

```

(End of definition for `\setmonofont`. This function is documented on page 27.)

**`\setmathrm`** These commands are analogous to `\setmainfont` and others, but for selecting the font used for `\mathrm`, etc. They can only be used in the preamble of the document. `\setboldmathrm` is used for specifying which fonts should be used in `\boldmath`.

```

64 \cs_new:Nn \@@_main_setmathrm:nn
65 {
66 (XE) \fontspec_gset_family:Nnn \g_@@_mathrm_tl {#1} {#2}
67 (LU) \fontspec_gset_family:Nnn \g_@@_mathrm_tl {Renderer=Basic,#1} {#2}

```

```

68     \@@_setmathrm_hook:nn {#1} {#2} % for unicode-math only
69   }

```

(End of definition for `\setmathrm`. This function is documented on page 27.)

### `\setboldmathrm`

```

70 \cs_new:Nn \@@_main_setboldmathrm:nn
71   {
72   (XE) \fontspec_gset_family:Nnn \g_@@_bfmathrm_tl {#1} {#2}
73   (LU) \fontspec_gset_family:Nnn \g_@@_bfmathrm_tl {Renderer=Basic,#1} {#2}
74     \@@_setboldmathrm_hook:nn {#1} {#2} % for unicode-math only
75   }

```

(End of definition for `\setboldmathrm`. This function is documented on page 27.)

### `\setmathsf`

```

76 \cs_new:Nn \@@_main_setmathsf:nn
77   {
78   (XE) \fontspec_gset_family:Nnn \g_@@_mathsf_tl {#1} {#2}
79   (LU) \fontspec_gset_family:Nnn \g_@@_mathsf_tl {Renderer=Basic,#1} {#2}
80     \@@_setmathsf_hook:nn {#1} {#2} % for unicode-math only
81   }

```

(End of definition for `\setmathsf`. This function is documented on page 27.)

### `\setmathtt`

```

82 \cs_new:Nn \@@_main_setmathtt:nn
83   {
84   (XE) \fontspec_gset_family:Nnn \g_@@_mathtt_tl {#1} {#2}
85   (LU) \fontspec_gset_family:Nnn \g_@@_mathtt_tl {Renderer=Basic,#1} {#2}
86     \@@_setmathtt_hook:nn {#1} {#2} % for unicode-math only
87   }

```

(End of definition for `\setmathtt`. This function is documented on page 27.)

#### Hooks:

```

88 \cs_set_eq:NN \@@_setmainfont_hook:nn \use_none:nn
89 \cs_set_eq:NN \@@_setsansfont_hook:nn \use_none:nn
90 \cs_set_eq:NN \@@_setmonofont_hook:nn \use_none:nn
91 \cs_set_eq:NN \@@_setmathrm_hook:nn \use_none:nn
92 \cs_set_eq:NN \@@_setmathsf_hook:nn \use_none:nn
93 \cs_set_eq:NN \@@_setmathtt_hook:nn \use_none:nn
94 \cs_set_eq:NN \@@_setboldmathrm_hook:nn \use_none:nn

```

Hmm, this isn't necessary with unicode-math; oh well:

```

95 \onlypreamble\setmathrm
96 \onlypreamble\setboldmathrm
97 \onlypreamble\setmathsf
98 \onlypreamble\setmathtt

```

If the commands above are not executed, then `\rmdefault` (*etc.*) will be used.

```

99 \tl_gset:Nn \g_@@_mathrm_tl {\rmdefault}
100 \tl_gset:Nn \g_@@_mathsf_tl {\sfdefault}
101 \tl_gset:Nn \g_@@_mathtt_tl {\ttdefault}

```

`\@@_main_newfontfamily:NnnN` The inner fontspec workings define a font family, which is then used in a typical NFSS `\fontfamily` declaration, saved in the macro name specified. The fourth argument determines which xparse function to set the macro with (`new/renew/etc`).

```

102 \cs_new:Nn \@@_main_newfontfamily:NnnN
103   {
104     \fontspec_set_family:cnn { l_@@_ \cs_to_str:N #1 _family_tl } {#2} {#3}
105     \use:x
106     {
107       \exp_not:N #4 \exp_not:N #1 {}
108       {
109         \exp_not:N \fontfamily { \use:c { l_@@_ \cs_to_str:N #1 _family_tl } }
110         \exp_not:N \fontencoding { \g_@@_nfss_enc_tl }
111         \exp_not:N \selectfont
112       }
113     }
114   }

```

*(End of definition for `\@@_main_newfontfamily:NnnN`. This function is documented on page ??.)*

`\@@_main_newfontface:NnnN` `\newfontface` uses the fact that if the argument to `BoldFont`, etc., is empty (*i.e.*, `BoldFont={}`), then no bold font is searched for.

```

115 \cs_new:Nn \@@_main_newfontface:NnnN
116   {
117     \@@_main_newfontfamily:NnnN #1 { BoldFont={},ItalicFont={},SmallCapsFont={},#2 } {#3} #4
118   }

```

*(End of definition for `\@@_main_newfontface:NnnN`. This function is documented on page ??.)*

## 1.2 Font feature selection

`\@@_set_default_features:nn`

```

119 \cs_new:Nn \@@_set_default_features:nn
120   {
121     \IfBooleanTF {#1} \clist_gput_right:Nn \clist_gset:Nn
122     \g_@@_default_fontopts_clist {#2}
123   }

```

*(End of definition for `\@@_set_default_features:nn`. This function is documented on page ??.)*

`\@@_set_font_default_features:nnn` The optional argument #2 specifies font identifier(s). Branch for either (a) single token input such as `\rmdefault`, or (b) otherwise assume its a fontname. In that case, strip spaces and file extensions and lower-case to ensure consistency.

`\addfontfeatures` In order to be able to extend the feature selection of a given font, two things need to be known: the currently selected features, and the currently selected font. Every time a font family is created, this information is saved inside a control sequence with the name of the font family itself.

This macro extracts this information, then appends the requested font features to add to the already existing ones, and calls the font again with the top level `\fontspec` command.

The default options are *not* applied (which is why `\g_fontspec_default_fontopts_tl` is emptied inside the group; this is allowed as `\l_fontspec_family_tl` is globally defined in `\@@_select_font_family:nn`), so this means that the only added features to the font are strictly those specified by this command.

`\addfontfeature` is defined as an alias, as I found that I often typed this instead when adding only a single font feature.

### 1.3 Defining new font features

`\newfontfeature` `\newfontfeature` takes two arguments: the name of the feature tag by which to reference it, and the string that is used to select the font feature.

```

```

*(End of definition for \newfontfeature. This function is documented on page ??.)*

`\newAATfeature` This command assigns a new AAT feature by its code (`#2`,`#3`) to a new name (`#1`). Better than `\newfontfeature` because it checks if the feature exists in the font it's being used for.

## 1 Programmer's interface

These functions are not used directly by fontspec when defining fonts; they are designed to be used by other packages who wish to do font-related things on top of fontspec itself.

Because I haven't fully explored how these functions will behave in practise, I am not giving them user-level names. As it becomes more clear which of these should be accessible by document writers, I'll open them up a little more.

All functions are defined assuming that the font to be queried is currently selected as a fontspec font. (I.e., via `\fontspec` or from a `\newfontfamily` macro or from `\setmainfont` and so on.)

## 2 Overview

### 2.1 Commands

---

`\fontspec_gset_family:Nnn` `\fontspec_set_family:Nnn`  $\langle family \rangle$   $\{\langle features \rangle\}$   $\{\langle font name \rangle\}$

`\fontspec_set_family:Nnn`

Defines a new NFSS font family from given  $\langle features \rangle$  and  $\langle font \rangle$ , and stores the name in the token list variable  $\langle family \rangle$ . See the standard fontspec user commands for applications of this function.

---

`\fontspec_gset_fontface:NNnn` `\fontspec_set_fontface:NNnn`  $\langle face \rangle$   $\langle family \rangle$   $\{\langle features \rangle\}$   $\{\langle font name \rangle\}$

`\fontspec_set_fontface:NNnn`

As for `\fontspec_set_family:Nnn` but with a single font face only. (E.g., no bold, italic shapes, etc.) The control sequence  $\langle face \rangle$  is a primitive T<sub>E</sub>X font command.

### 2.2 Conditionals

---

`\fontspec_font_if_exist:nTF` `\fontspec_font_if_exist:nTF`  $\{\langle font name \rangle\}$  Argtrue code  $\{\langle false code \rangle\}$

Does this font exist? The font name can refer to the 'logical' name or to a filename with known font extension.

---

`\fontspec_if_fontspec_font:TF` `\fontspec_if_fontspec_font:TF`  $\{\langle true code \rangle\}$   $\{\langle false code \rangle\}$

---

`\fontspec_if_aat_feature:nnTF` `\fontspec_if_aat_feature:nnTF`  $\{\langle true code \rangle\}$   $\{\langle false code \rangle\}$

---

`\fontspec_if_opentype:TF` `\fontspec_if_opentype:TF`  $\{\langle true code \rangle\}$   $\{\langle false code \rangle\}$

<u>\fontspec_if_feature:nTF</u>	<u>\fontspec_if_feature:nTF</u> {<feat tag>} {<>true code>} {<>false code>}
	Check if the raw OpenType <feature tag> is available in the current font with script and language settings as set up when the font was loaded.
<u>\fontspec_if_feature:nnnTF</u>	<u>\fontspec_if_feature:nnnTF</u> {<script tag>} {<lang tag>} {<feat tag>} {<>true code>} {<>false code>}
	<u>\fontspec_if_feature:nTF</u> {latn} {ROM} {pnum} {True} {False}
	Test whether the currently selected font with raw OpenType <script tag> and raw OpenType <language tag> contains the raw OpenType <feature tag>. Returns false if the font is not loaded by fontspec or is not an OpenType font.
<u>\fontspec_if_script:nTF</u>	<u>\fontspec_if_script:nTF</u> {<script tag>} {<>true code>} {<>false code>}

33 }
```

*(End of definition for `\fontspec_if_opentype:TF`. This function is documented on page 41.)*

`\fontspec_if_feature:nTF`

Test whether the currently selected font contains the raw OpenType feature #1. E.g.: `\fontspec_if_feature:nTF {pnum} {True} {False}` Returns false if the font is not loaded by fontspec or is not an OpenType font.

```

## 1 Internals

### 1.1 The main function for setting fonts

`\@@_select_font_family:nn` This is the command that defines font families for use, the underlying procedure of all `\fontspec`-like commands. Given a list of font features (`#1`) for a requested font (`#2`), it will define an NFSS family for that font and put the family name (globally) into `\l_fontspec_family_tl`. The TeX `\font` command is (globally) stored in `\l_fontspec_font`.

This macro does its processing inside a group to attempt to restrict the scope of its internal processing. This works to some degree to insulate the internal commands from having to be manually cleared.

Some often-used variables to know about:

- `\l_fontspec_fontname_tl` is used as the generic name of the font being defined.
- `\l_@@_fontid_tl` is the unique identifier of the font with all its features.
- `\l_@@_fontname_up_tl` is the font specifically to be used as the upright font.
- `\l_@@_basename_tl` is the (immutable) original argument used for `*`-replacing.
- `\l_fontspec_font` is the plain TeX font of the upright font requested.

## 1.2 Setting font shapes in a family

All NFSS specifications take their default values, so if any of them are redefined, the shapes will be selected to fit in with the current state. For example, if `\bfdefault` is redefined to `b`, all bold shapes defined by this package will also be assigned to `b`.

The combination shapes are searched first because they use information that may be redefined in the single cases. E.g., if no bold font is specified then `set_autofont` will attempt to set it. This has subtle/small ramifications on the logic of choosing the bold italic font.

`\@@_find_autofonts:`

#### 1.2.1 Fonts

\@@\_set\_font\_type:N Now check if the font is to be rendered with `ATSUI` or `Harfbuzz`. This will either be automatic (based on the font type), or specified by the user via a font feature.

This macro sets booleans accordingly depending if the font in `\l_fontspeg_test_font` is an `AAT` font or an OpenType font or a font with feature axes (either `AAT` or Multiple Master), respectively.

```

```

If automatic, the `\l_@@_renderer_tl` token list will still be empty (other suffices that could be added will be later in the feature processing), and if it is indeed still empty, assign it a value so that the other weights of the font are specifically loaded with the same renderer.

LuaTeX only supports one:

```

405 <*LU>
406 \bool_set_true:N \l_@@_ot_bool

                    #2 : Base font name
                    #3 : Font name modifier

```

This function looks for font with `<name>` and `<modifier>` #2#3, and if found (i.e., different to font with name #2) stores it in tl #1. A modifier is something like `/B` to look for a bold font, for example.

We can't match external fonts in this way (in X<sub>Y</sub>TeX anyway; todo: test with LuaTeX). If `<font name tl>` is not empty, then it's already been specified by the user so abort. If `<Base font name>` is not given, we also abort for obvious reasons.

If `<font name tl>` is empty, then proceed. If not found, `<font name tl>` remains empty. Otherwise, we have a match.

Wrapper for \DeclareFontShape. And finally the actual font shape declaration using \l\_@@\_nfss\_tl defined above. \l\_@@\_postadjust\_tl is defined in various places to deal with things like the hyphenation character and interword spacing.

The main part is to loop through SizeFeatures arguments, which are of the form

This extra stuff for the slanted shape substitution is a little bit awkward. We define the slanted shape to be a synonym for it when (a) we're defining an italic font, but also (b) when the default slanted shape isn't 'it'. (Presumably this turned up once in a test and I realised it caused problems. I doubt this would happen much.)

We should test when a slanted font has been specified and not run this code if so, but the \@@\_set\_slanted: code will overwrite this anyway if necessary.

\@@\_iv\_str\_to\_num:Nn This macro takes a four character string and converts it to the numerical representation required for X<sub>Y</sub>TeX OpenType script/language/feature purposes. The output is stored in #1.

This code is not used in LuaTeX, as the checking for that engine is done via Lua code provided by luaotfload.

```

798 \cs_generate_variant:Nn \@@_iv_str_to_num:Nn {Nx}

```

The input can be of the form of any of these: ‘abcd’, ‘abc’, ‘abc ’, ‘ab’, ‘ab ’, etc. (It is assumed the first two chars are *always* not spaces.) So this macro reads in the string padded with \@empty s, and anything beyond four chars is snipped. The \@empty s then are used to reconstruct the spaces in the string to number calculation.

For backwards compatibility this code also strips a leading + or -.

```
799 \cs_set:Npn \@@_strip_leading_sign:Nw #1#2#3 \q_nil
800 {
801   \bool_if:nTF { \str_if_eq_p:nn {#2} {+} || \str_if_eq_p:nn {#2} {-} }
802     { \@@_iv_str_to_num:w #1 \q_nil #3 \c_empty_tl \c_empty_tl \q_nil }
803     { \@@_iv_str_to_num:w #1 \q_nil #2#3 \c_empty_tl \c_empty_tl \q_nil }
804 }
```

If input string (after sign is stripped) is more than 4 chars, #6 will contain '`<excess>\c_empty_tl\c_empty_tl`'. Therefore use #6 to verify string length.

1. remove the feature being added (to avoid duplicates);
2. remove the inverse of the feature (to avoid cancellation);
3. finally remove all clashing features.

`\@@_make_AAT_feature_string:NnnTF`

This macro takes the numerical codes for a font feature and creates a specified macro containing the string required in the font definition to turn that feature on or off. Used primarily in [...], but also used to check if small caps exists in the requested font (see page 66).

For exclusive selectors, it's easy; just grab the string: For *non*-exclusive selectors, it's a little more complex. If the selector is even, it corresponds to switching the feature on. If the selector is *odd*, it corresponds to switching the feature off. But Xe<sub>La</sub>TeX doesn't return a selector string for this number, since the feature is defined for the 'switching on' value. So

we need to check the selector of the previous number, and then prefix the feature string with ! to denote the switch.

Finally, save out the complete feature string in `\l_fontspec_feature_string_tl`.

## 1 Font loading (keyval) definitions

This package uses a large number of keyval modules which operate sequentially on keyval input to ensure priority.

```
1 \clist_gset:Nn \g_@@_all_keyval_modules_clist
2 {
3   fontspec, fontspec-opentype, fontspec-aat,
4   fontspec-preparse, fontspec-preparse-cfg, fontspec-preparse-external, fontspec-preparse-ne
5   fontspec-renderer
6 }
```

Wrapper function to save some characters in the source:

```
7 \cs_new:Nn \@@_keys_define_code:nnn
8 {
9   \keys_define:nn {#1} { #2 .code:n = {#3} }
10 }
```

For catching features that cannot be used in `\addfontfeatures`:

```
11 \cs_new:Nn \@@_aff_error:n
12 {
13   \@@_keys_define_code:nnn {fontspec-addfeatures} {#1}
14   { \@@_error:nx {not-in-addfontfeatures} {#1} }
15 }
```

### 1.1 Pre-pre-parsing stages

These features are extracted from the font feature list before all others.

#### Don't load font config file

```
16 \@@_keys_define_code:nnn {fontspec-preparse-cfg} {IgnoreFontspecFile}
17 {
18   \bool_set_false:N \l_@@_fontcfg_bool
19 }
20 \@@_keys_define_code:nnn {fontspec-preparse-external} {IgnoreFontspecFile}
21 {
22   \bool_set_false:N \l_@@_fontcfg_bool
23 }
```

**Path** For fonts that aren't installed in the system. If no argument is given, the font is located with `kpsewhich`; it's either in the current directory or the  $\TeX$  tree. Otherwise, the argument given defines the file path of the font.

```
24 \@@_keys_define_code:nnn {fontspec-preparse-external} {Path}
25 {
26   \bool_set_true:N \l_@@_nobf_bool
27   \bool_set_true:N \l_@@_noit_bool

32 </XE>
33 }
34 \aliasfontfeature{Path}{ExternalLocation}
35 \@@_keys_define_code:nmn {fontspec} {Path} {}

```

(End of definition for Path. This function is documented on page ??.)

**Extension** For fonts that aren't installed in the system. Specifies the font extension to use.

```

36 \@@_keys_define_code:nmn {fontspec-prepare-external} {Extension}
37 {
38     \tl_set:Nn \l_@@_extension_tl {#1}
39     \bool_if:NF \l_@@_external_bool

42     }
43 }
44 \tl_clear:N \l_@@_extension_tl
45 \@@_keys_define_code:nmn {fontspec} {Extension} {}

```

**KpseOnly** If the font is specified by filename, only search for it through kpse. Xe<sub>La</sub>TeX does not support finding system fonts by filename so this is always implicitly set there.

```

46 \@@_keys_define_code:nmn {fontspec-prepare-external} {KpseOnly}
47 {
48     \bool_set_true:N \l_@@_external_kpse_bool
49     \bool_if:NT \l_@@_external_bool \@@_font_is_file:
50 }
51 \@@_keys_define_code:nmn {fontspec} {KpseOnly} {}

**Renderer** This feature must be processed before all others (the other font shape and features options are also pre-parsed for convenience) because the renderer determines the format of the features and whether certain features are available.

## 1.4 General font-independent features

These features can be applied to any font.

**NFSS encoding** For the very brave.

```

287 \@@_keys_define_code:nmn {fontspec-preparse} {NFSSEncoding}
288 {
289   \tl_gset:Nx \g_@@_nfss_enc_tl { #1 }
290 }

```

**NFSS family** Interactions with other packages will sometimes require setting the NFSS family explicitly. (By default `fontspec` auto-generates one based on the font name.)

```

291 \@@_keys_define_code:nmn {fontspec-preparse} {NFSSFamilY}
292 {
293   \tl_set:Nx \l_@@_nfss_fam_tl { #1 }
294 }

```

**NFSS series/shape** This option looks similar in name but has a very different function.

```

295 \@@_keys_define_code:nmn {fontspec-preparse} {FontFace}
296 {
297   \tl_clear:N \l_@@_this_font_tl
298   \clist_set:No \l_@@_arg_clist { \use_iii:nmn #1 }
299   \clist_set_eq:NN \l_@@_this_feat_clist \l_@@_arg_clist
300   \int_compare:nT { \clist_count:N \l_@@_arg_clist = 1 }
301   {
302     <debug>\typeout{FontFace~ parsing:~ one~ clist~ item}
303     \tl_if_in:NnF \l_@@_arg_clist {=}
304     {
305       <debug>\typeout{FontFace~ parsing:~ no~ equals~ =>~ font~ name~ only}
306       \tl_set_eq:NN \l_@@_this_font_tl \l_@@_arg_clist
307       \tl_clear:N \l_@@_this_feat_clist
308     }
309   }
310
311   \@@_add_nfssfont:nnnn
312   {\use_i:nmn #1} {\use_ii:nmn #1} {\l_@@_this_font_tl} {\l_@@_this_feat_clist}
313 }

```

**Scale** If the input isn't one of the pre-defined string options, then it's gotta be numerical. `\fontspec_calc_scale:n` and `\fontspec_calc_scale:nn` do all the work in the auto-scaling cases.

```

314 \@@_keys_define_code:nmn {fontspec} {Scale}
315 {

```

```

316 \str_case:nnF {#1}
317 {
318   {MatchLowercase} { \@@_calc_scale:n {5} }
319   {MatchUppercase} { \@@_calc_scale:n {8} }
320   {MatchAveragecase} { \@@_calc_scale:nn {5} {8} }
321 }
322 { \tl_set:Nx \l_@@_scale_tl {#1} }
323 \@@_info:n {set-scale}
324 }

```

### ScaleAgain

```

325 \@@_keys_define_code:nnn {fontspec} {ScaleAgain}
326 {
327   \tl_if_empty:NT \l_@@_scale_tl { \tl_set:Nn \l_@@_scale_tl {1} }
328   \tl_set:Nx \l_@@_scale_tl { \fp_eval:n { #1 * \l_@@_scale_tl } }
329   \@@_info:n {set-scale}
330 }

```

`\@@_calc_scale:n` This macro calculates the amount of scaling between the default roman font and the (default shape of) the font being selected such that the font dimension that is input is equal for both. The only font dimensions that justify this are 5 (lowercase height) and 8 (uppercase height in X<sub>Y</sub>T<sub>E</sub>X).

This script is executed for every extra shape, which seems wasteful, but allows alternate italic shapes from a separate font, say, to be loaded and to be auto-scaled correctly. Even if this would be ugly.

To begin, change to `\rmfamily` but use internal commands in case `csrmfamily` has been overwritten. (Note that changing `\rmfamily` with `fontspec` resets `\encodingdefault` appropriately.)

```

331 \cs_new:Nn \@@_calc_scale:n
332 {
333   \group_begin:

345                 \dim_to_fp:n {\l_@@_tmpb_dim} }
346   }
347
348   \exp_args:NNNx
349   \group_end:

351 }

```

*(End of definition for `\@@_calc_scale:n`. This function is documented on page ??.)*

`\@@_calc_scale:nn` This macro calls `\fontspec_calc_scale:n` twice and then sets the scale to the average of the two results.

```

352 \cs_new:Nn \@@_calc_scale:nn
353 {
354   \group_begin:
355     \__fontspec_calc_scale:n {#1}
356     \tl_set_eq:NN \l_@@_tmp_tl \l_@@_scale_tl
357     \__fontspec_calc_scale:n {#2}
358     \tl_set:Nx \l_@@_scale_tl
359       {
360         \fp_eval:n { (\l_@@_tmp_tl + \l_@@_scale_tl)/2 }
361       }
362     \exp_args:NNNx
363     \group_end:
364     \tl_set:Nx \l_@@_scale_tl { \l_@@_scale_tl }
365   }

```

*(End of definition for \@@\_calc\_scale:nn. This function is documented on page ??.)*

`\@@_set_font_dimen:NnN` This function sets the dimension #1 (for font #3) to ‘fontdimen’ #2 for either font dimension 5 (x-height) or 8 (cap-height). If, for some reason, these return an incorrect ‘zero’ value (as `\fontdimen8` might for a .tfm font), then we cheat and measure the height of a glyph. We assume in this case that the font contains either an ‘X’ or an ‘x’.

```

366 \cs_new:Nn \@@_set_font_dimen:NnN
367 {
368   \dim_set:Nn #1 { \fontdimen #2 #3 }
369   \dim_compare:nNnT #1 = {0pt}

386 }
387 \@@_aff_error:n {WordSpace}

```

`\fontspec_parse_wordspace:w` This macro determines if the input to `WordSpace` is of the form `{X}` or `{X,Y,Z}` and executes the font scaling. If the former input, it executes `{X,X,X}`.

```

388 \cs_set:Npn \fontspec_parse_wordspace:w #1,#2,#3,#4 \q_stop

**Hyphenation character** This feature takes one of three arguments: ‘None’,  $\langle glyph \rangle$ , or  $\langle slot \rangle$ . If the input isn’t the first, and it’s one character, then it’s the second; otherwise, it’s the third.

LuaTeX decouples hyphenation from font settings, so only HyphenChar=None works for that engine.

For other potentially font specific variation axes, there is a raw setter available:

```

601 \@@_keys_define_code:nmn {fontspec-opentype} {RawAxis}
602   {
603     \prop_gput_from_keyval:Nn \g_@@_rawvariations_prop {#1}

```

#### 1.4.2 Variation instances

606   {
607     \tl_gset:Nn \g_@@_instance_tl {#1}
608   }

```

#### 1.4.3 Font transformations

These are to be specified to apply directly to a font shape:

```

609 \keys_define:nn {fontspec}
610 {
611   FakeSlant .code:n =
612     {
613       \@@_update_featstr:n {slant=#1}
614     },
615   FakeSlant .default:n = {0.2}
616 }
617 \keys_define:nn {fontspec}
618 {
619   FakeStretch .code:n =
620     {
621       \@@_update_featstr:n {extend=#1}
622     },
623   FakeStretch .default:n = {1.2}
624 }
625 \keys_define:nn {fontspec}
626 {
627   FakeBold .code:n =
628     {
629       \@@_update_featstr:n {embolden=#1}
630     },
631   FakeBold .default:n = {1.5}
632 }

```

These are to be given to a shape that has no real bold/italic to signal that `fontspec` should automatically create ‘fake’ shapes.

The behaviour is currently that only if both `AutoFakeSlant` *and* `AutoFakeBold` are specified, the bold italic is also faked.

These features presently *override* real shapes found in the font; in the future I’d like these features to be ignored in this case, instead. (This is just a bit harder to program in the current design of `fontspec`.)

```

633 \keys_define:nn {fontspec}
634 {
635   AutoFakeSlant .code:n =
636     {

645         {
646           \clist_put_right:Nx \l_@@_fontfeat_bfit_clist
647             {FakeBold=\l_@@_fake_embolden_tl}

649           \tl_set_eq:NN \l_@@_fontname_bfit_tl \l_fontspec_fontname_tl
650         }
651       }

```

```

652     },
653     AutoFakeSlant .default:n = {0.2}
654 }

```

Same but reversed:

```

655 \keys_define:nm {fontspec}

## 1 Selecting maths fonts

Here, the fonts used in math mode are redefined to correspond to the default roman, sans serif and typewriter fonts. Unfortunately, you can only define maths fonts in the preamble, otherwise I'd run this code whenever `\setmainfont` and friends was run.

`\fontspec_setup_maths:` Everything here is performed `\AtBeginDocument` in order to overwrite euler's attempt. This means `fontspec` must be loaded *after* euler. We set up a conditional to return an error if this rule is violated.

Since every maths setup is slightly different, we also take different paths for defining various math glyphs depending which maths font package has been loaded.

```
1 \ifpackageloaded{euler}
2   { \bool_gset_true:N \g_@@_pkg_euler_loaded_bool }
3   { \bool_gset_false:N \g_@@_pkg_euler_loaded_bool }
4 \cs_new:Nn \fontspec_setup_maths:
5   {
6     \ifpackageloaded{euler}
7       {
8         \bool_if:NTF \g_@@_pkg_euler_loaded_bool
9           { \bool_gset_true:N \g_@@_math_euler_bool }
10          { \@@_error:n {euler-too-late} }
11        }
12      {}
13 \ifpackageloaded{lucbmath}{ \bool_gset_true:N \g_@@_math_lucida_bool }{}
14 \ifpackageloaded{lucidabr}{ \bool_gset_true:N \g_@@_math_lucida_bool }{}
15 \ifpackageloaded{lucimatx}{ \bool_gset_true:N \g_@@_math_lucida_bool }{}

```

Knuth's CM fonts are all squashed together, combining letters, accents, text symbols and maths symbols all in the one font, `cmr`, plus other things in other fonts. Because we are changing the roman font in the document, we need to redefine all of the maths glyphs in L<sup>A</sup>T<sub>E</sub>X's operators maths font to still go back to the legacy `cmr` font for all these random glyphs, unless a separate maths font package has been loaded instead.

In every case, the maths accents are always taken from the operators font, which is generally the main text font. (Actually, there is a `\hat` accent in EulerFraktur, but it's *ugly*. So I ignore it. Sorry if this causes inconvenience.)

```
16 \DeclareSymbolFont{legacymaths}{OT1}{cmr}{m}{n}
17 \SetSymbolFont{legacymaths}{bold}{OT1}{cmr}{bx}{n}
18 \DeclareMathAccent{\acute}   {\mathalpha}{legacymaths}{19}
19 \DeclareMathAccent{\grave}   {\mathalpha}{legacymaths}{18}
20 \DeclareMathAccent{\ddot}    {\mathalpha}{legacymaths}{127}
21 \DeclareMathAccent{\tilde}   {\mathalpha}{legacymaths}{126}
22 \DeclareMathAccent{\bar}     {\mathalpha}{legacymaths}{22}
23 \DeclareMathAccent{\breve}   {\mathalpha}{legacymaths}{21}
24 \DeclareMathAccent{\check}   {\mathalpha}{legacymaths}{20}
25 \DeclareMathAccent{\hat}     {\mathalpha}{legacymaths}{94} % too bad, euler

```

```

26 \DeclareMathAccent{\dot}      {\mathalpha}{legacymaths}{95}
27 \DeclareMathAccent{\mathring}{\mathalpha}{legacymaths}{23}

```

`\colon`: **what's going on?** Okay, so `:` and `\colon` in maths mode are defined in a few places, so I need to work out what does what. Respectively, we have:

```

% % fontmath.ltx:
% \DeclareMathSymbol{\colon}{\mathpunct}{operators}{"3A}
% \DeclareMathSymbol{:}{\mathrel}{operators}{"3A}
%
% % amsmath.sty:
% \renewcommand{\colon}{\nobreak\mskip2mu\mathpunct{}\nonscript
% \mkern-\thinmuskip{:}\mskip6mu\plus1mu\relax}
%
% % euler.sty:
% \DeclareMathSymbol{:}{\mathrel}{EulerFraktur}{"3A}
%
% % lucbmath.sty:
% \DeclareMathSymbol{\@tempb}{\mathpunct}{operators}{58}
% \ifx\colon\@tempb
% \DeclareMathSymbol{\colon}{\mathpunct}{operators}{58}
% \fi
% \DeclareMathSymbol{:}{\mathrel}{operators}{58}

```

( $3A_{16} = 58_{10}$ ) So I think, based on this summary, that it is fair to tell fontspec to 'replace' the operators font with legacymaths for this symbol, except when amsmath is loaded since we want to keep its definition.

```

28 \group_begin:
29 \mathchardef\@tempa="603A \relax
30 \ifx\colon\@tempa
31 \DeclareMathSymbol{\colon}{\mathpunct}{legacymaths}{58}
32 \fi
33 \group_end:

```

The following symbols are only defined specifically in euler, so skip them if that package is loaded.

```

34 \bool_if:NF \g_@@_math_euler_bool
35 {
36 \DeclareMathSymbol{!}{\mathclose}{legacymaths}{33}
37 \DeclareMathSymbol{:}{\mathrel}{legacymaths}{58}
38 \DeclareMathSymbol{;}{\mathpunct}{legacymaths}{59}
39 \DeclareMathSymbol{?}{\mathclose}{legacymaths}{63}

```

And these ones are defined both in euler and lucbmath, so we only need to run this code if no extra maths package has been loaded.

```

40 \bool_if:NF \g_@@_math_lucida_bool
41 {
42 \DeclareMathSymbol{0}{\mathalpha}{legacymaths}{`0}
43 \DeclareMathSymbol{1}{\mathalpha}{legacymaths}{`1}

Finally, we change the font definitions for `\mathrm` and so on. These are defined using the `\g_@@_mathrm_tl (...)` macros, which default to `\rmdefault` but may be specified with the `\setmathrm (...)` commands in the preamble.

Since  $\LaTeX$  only generally defines one level of boldness, we omit `\mathbf` in the bold maths series. It can be specified as per usual with `\setboldmathrm`, which stores the appropriate family name in `\g_@@_bfmathrm_tl`.

`\fontspec_maybe_setup_maths`: We're a little less sophisticated about not executing the maths setup if various other maths font packages are loaded. This list is based on the wonderful 'L<sup>A</sup>T<sub>E</sub>X Font Catalogue': <http://www.tug.dk/FontCatalogue/mathfonts.html>. I'm sure there are more I've missed. Do the T<sub>E</sub>X Gyre fonts have maths support yet?

Untested: would `\unless\ifnum\Gamma=28672\relax\bool_set_false:N \g_@@_math_bool\fi` be a better test? This needs more cooperation with euler and lucida, I think.

## 1 Changes/additions to the NFSS

---

`\strong` `\strong {⟨text⟩}`

`\strongenv` `\begin{strongenv} ⟨text⟩ \end{strongenv}`

---

Typesets text in the ‘strong’ font. NFSS series equivalent to `\emph`. Can be nested.

---

`\strongfontdeclare` `\strongfontdeclare {⟨comma-separated font switch declarations⟩}`

---

Define the behaviour of nested `\strong` commands.

---

`\strongreset` `\renewcommand \strongreset {⟨font switch declarations⟩}`

---

Define the behaviour when a `\strong` command is nested deeper than the definitions provided by `\strongfontdeclare`. By default this is `⟨empty⟩` — i.e., bold on top of bold remains bold. In certain circumstances it may be appropriate to reset to a default state.

## 2 Implementation

1 `⟨*fontspec⟩`

### 2.1 Italic small caps and so on

2 `\providecommand*\scitdefault{\scdefault\itdefault}`

3 `\providecommand*\scsldefault{\scdefault\sldefault}`

4 `\providecommand*\scswdefault{\scdefault\swdefault}`

L<sup>A</sup>T<sub>E</sub>X’s ‘shape’ font axis needs to be overloaded to support italic small caps and slanted small caps. These are the combinations to support:

5 `\cs_new:Nn \@@_shape_merge:nn { c_@@_shape_#1_#2_tl }`

6 `\cs_new:Nn \@@_merge_default_shapes:`

7 `{`

8 `\tl_const:cn { \@@_shape_merge:nn \shapedefault\scdefault } {\scdefault}`

9 `\tl_const:cn { \@@_shape_merge:nn \itdefault \scdefault } {\scitdefault}`

10 `\tl_const:cn { \@@_shape_merge:nn \sldefault \scdefault } {\scsldefault}`

11 `\tl_const:cn { \@@_shape_merge:nn \swdefault \scdefault } {\scswdefault}`

12 `\tl_const:cn { \@@_shape_merge:nn \scdefault \itdefault } {\scitdefault}`

13 `\tl_const:cn { \@@_shape_merge:nn \scdefault \sldefault } {\scsldefault}`

14 `\tl_const:cn { \@@_shape_merge:nn \scdefault \swdefault } {\scswdefault}`

15 `\tl_const:cn { \@@_shape_merge:nn \scsldefault \itdefault } {\scitdefault}`

16 `\tl_const:cn { \@@_shape_merge:nn \scitdefault \sldefault } {\scsldefault}`

17 `\tl_const:cn { \@@_shape_merge:nn \scitdefault \shapedefault } {\scdefault}`

18 `\tl_const:cn { \@@_shape_merge:nn \scsldefault \shapedefault } {\scdefault}`

19 `}`

20 `\@@_merge_default_shapes:`

The following is rather specific; it only returns true if the merged shape exists, but more importantly also if the merged shape is defined for the current font.

```

21 \prg_new_conditional:Nnn \@@_if_merge_shape:n {TF}
22 {

31     }
32   \prg_return_true: \prg_return_false:
